Definitions used within Veridical to determine the direction  
in which reads are checked. In addition, a list of putative  
splicing variants returned by variant prediction software can  
often be extremely large.

Furthermore, junction-spanning exons skipping is, in general, rarer than in  
This may lead to either missing contradictory evidence or to  
discarding a variant due to the perceived observation of  
statistically insignificant altered splicing within control  
samples. It is important to note that acceptance of the null  
hypothesis, due to an absence of evidence required to disprove  
it, does not imply that the underlying prediction of a  
mutation at a particular locus is incorrect, but merely that  
the current empirical methods employed were insufficient to  
corroborate it. The concordance between ROGAN Arrowhead 4  
splicing outcomes generated by these mutations and the  
Veridical results indicates that the proposed method detects  
both mutations that inactivate splice sites and cryptic splice  
site activation.
